MAI PO INNER DEEP BAY RAMSAR SITE WATERBIRD MONITORING PROGRAMME

Programme 2006 / 07

Shorebird Monitoring

July 2006 - June 2007

Shorebird Monitoring: 2006-07 Report

Introduction

Systematic, long-term monitoring of waterbirds in the Mai Po Inner Deep Bay Ramsar Site commenced in March 1998. Counts of shorebirds (also called waders) form one part of this programme, the other components being monthly counts of waterbirds and surveys of ardeid nesting colonies. This report concerns the shorebird monitoring component from July 2006 to June 2007. This project is a part of the tender project (contract tender reference no. AFCD/SQ/16/06) and it is administered, coordinated and executed by the Hong Kong Bird Watching Society (HKBWS), and funded by the Agriculture, Fisheries and Conservation Department (AFCD).

Methodology

Shorebirds mainly occur in Hong Kong during three periods: autumn and spring for migration, and the winter. This study aims to monitor shorebirds numbers in the Mai Po Inner Deep Bay Ramsar Site through the year. Frequency of survey is higher during the main passage period (late March to late May and July to late October) but less frequent during summer. Surveys in winter time (i.e. November to mid-March) are covered by the monthly waterbird count. The schedule of this shorebird monitoring programme is as follows:

- 22 March to 1 June: one count every block of three days
- 2 to 30 June: two counts per month
- 1 July to 4 November: one count per week
- Mid November to mid March: once count per month

The main survey site is the Mai Po Nature Reserve (Map 1) where counts are made either in the *gei wai* or from the two boardwalk birdwatching hides, depending on the height of the tide. In general, counting during the high tide period is conducted in the *gei wai* where suitable roosting areas on the reserve are provided as a result of

the management activities of WWF HK; these regular and generally rather stable roosting sites allow counts to be made with a relatively high degree of accuracy for many species. In contrast, counts are made from the boardwalk hides during mid tide periods where the shorebirds feed in the intertidal area. The counts are usually made using the following procedures:

- Count birds from the boardwalk hide during the rising tide, beginning at a tidal height of around 1.9m.
- Count birds roosting in MPNR using a bicycle (essential to complete the count during the time available).
- Count birds from the boardwalk hide during the falling tide until such a time as counting is no longer possible due to distance from the observer.

The equipment used consisted of 8x or 10x binoculars and a telescope with wide angle or 20-60x zoom eyepieces. Counting was carried out by HKBWS accredited surveyors experienced in bird counting and identification, in order to achieve a high degree of accuracy. All shorebirds present in the counting areas are counted for each species. If birds carrying leg flags for migration route studies are present, the details are also recorded, including the colour and position of the flags, the species, age and/or the extent of breeding plumage acquired.

Results

Results of all shorebird counts are presented in full in Appendices 1 and 2. The numbers of selected species are illustrated graphically in Appendix 3.

Autumn 2006

Figure 1 shows the numbers of all shorebird counts in the autumn 2006. Numbers were relatively low in July and gradually increased toward the end of the autumn in October. Several higher numbers were noted, including 2,748 birds on 30 July, 3,236 birds on 22 August, 4,169 birds on 24 September and 4,928 birds on 9 October. The later one is also the highest count in the autumn 2006. These several peaks of birds indicate that migratory shorebirds passed through Mai Po in different periods, for example: Common Redshanks *Tringa totanus* on 30 July, Common Greenshanks *Tringa nebularia* on 22 August and 24 September, Wood Sandpipers *Tringa glareola* on 9 October.

In addition, the two peaks in September and October might actually consist of some wintering shorebirds, e.g. Black-tailed Godwit *Limosa limosa*, Eurasian Curlew

Numenius arquata, Spotted Redshank *Tringa erythropus* and Marsh Sandpiper *Tringa stagnatilis*. Some details of arrival of these wintering species are shown in the figures:

Black-tailed Godwit – late September (Figure 8, c.f. mid September 2005 and 2004, early September 2003, late August 2002)

Eurasian Curlew – September to early October (Figure 11, c.f. mid September 2005, 2004, 2003 and 2002)

Spotted Redshank – late October (Figure 12, c.f. mid October 2005, 2004, 2003, late September 2002)

Marsh Sandpiper – late September (Figure 14, c.f. late September 2005, 2004, mid September 2003, early September 2002)

Numbers of other shorebirds that clearly appear to be passage migrants in the autumn 2006, include Pacific Golden Plover *Pluvialis fulva* (Figure 3), Lesser Sand Plover *C. mongolus* (Figure 6), Greater Sand Plover *C. leschenaultii* (Figure 7), Bar-tailed Godwit *Limosa lapponica* (Figure 9), Whimbrel *Numenius phaeopus* (Figure 10), Common Redshank (Figure 13), Wood Sandpiper (Figure 16), Red Knot *Calidris canutus* (Figure 18) and Broad-billed Sandpiper *Limicola falcinellus* (Figure 19). The two most numerous species during the 2006 autumn migration are Common Greenshank and Common Redshank, which had a peak count of 1,816 in late August and 1470 in late July respectively.

Winter 2006-2007

The sum of the peak counts of each shorebird species during the mid-winter period, i.e. December, January and February, constitutes the winter aggregate of shorebird species. The aggregate in winter 2006-07 was 22,259 birds of the positively identified shorebirds in the whole Deep Bay area. The five most numerous species were Pied Avocet *Recurvirostra avosetta* (11,957), Common Greenshank (1,522), Spotted Redshank (1,151), Eurasian Curlew (1,049) and Marsh Sandpiper (796). The count of Pied Avocet is the new highest figure for the Deep Bay area, while the counts of the Common Greenshank and Black-tailed Godwit (at 693 individuals) were also the new high counts for winter period. However, small unidentified shorebirds presumed to be mainly Kentish Plovers and Dunlins, numbered 2,150 in the December count showing a decline of more than 50% from a figure of 5,500 individuals recorded in the previous winter.

Spring 2007

For numbers of shorebirds in spring 2007 refer to Figure 20, which shows a decrease

in numbers in late March and early April and a rebound to reach a peak count for the spring in mid-April. Subsequently, numbers fluctuated in the second half of the spring with two smaller influxes in early and the middle of May. Finally, numbers further decreased in the second half of May and in June. The spring peak count was recorded at 15,149 individuals on 17 April, which is also a new high figure for the spring shorebird migration since the commencement of this monitoring programme. This peak count is almost doubled the figure of the previous spring at 7,710 individuals. The 2007 spring aggregate of shorebird species is 21,223 birds, which has a 50% increase from the same aggregates of both 2005 and 2006 springs.

Several shorebird species apparently showing decreases of their numbers in the previous springs were discussed in last reports (Table 1, Anon. 2005 and 2006). Table 1 shows their figures for this spring and previous springs. Most of the species showed a recovery in numbers in this spring, while Pacific Golden Plover and Long-toed Stint *Calidris subminuta* were still counted in relatively lower numbers.

Table 1. Peak counts of some shorebirds with a declining trend in recent springs.

Species	2007	2006	2005	2004	2003
Pacific Golden Plover <i>Pluvialis fulva</i>	160	219	54	221	358
Lesser Sand Plover <i>Charadrius mongolus</i>	179	35	30	59	115
Ruddy Turnstone <i>Arenaria interpres</i>	100	34	39	80	86
Red Knot <i>Calidris canutus</i>	144	16	5	120	62
Red-necked Stint <i>C. ruficollis</i>	2,239	1,478	1,909	2,239	2,302
Long-toed Stint <i>C. subminuta</i>	4	11	7	36	11
Sharp-tailed Sandpiper <i>C. acuminata</i>	175	68	41	300	231
Curlew Sandpiper <i>C. ferruginea</i>	10,982	4,151	3,947	6,000	4,535
Total spring aggregate number	21,223	14,942	14,312	16,431	16,836

Summer 2007

Two counts were conducted in June 2007, which provided figures of 369 and 63 birds on 8 and 18 June respectively. Compared to figures of previous springs, these summer figures are relatively lower than those from 2002 to 2005. The highest single-species flock was a total of 177 Terek Sandpipers *Xenus cinereus* on 8 June.

Aggregate numbers recorded

The aggregate total number of shorebirds recorded in spring and autumn is derived by using the peak count for each season added to, where possible, by the sum of influxes of new birds, assessed from the pattern of occurrence and/or differences in the amount or types of breeding plumage. In an attempt to estimate a total number of shorebirds that utilized the Mai Po Inner Deep Bay Ramsar Site during the 12-month period from July 2006 to June 2007, the peak winter count (i.e. December to February) obtained during winter waterbird counts can also be added. However, it is not possible to rule out some overlap in individuals occurring in different seasons; consequently, such records (marked by a dash in Table 2) are excluded from the calculation.

Table 2. Estimated minimum number of shorebirds utilizing the Mai Po Inner Deep Bay Ramsar Site during the 12-month period July 2006 to June 2007.

Year	2006	2006-07	2007	2006-07	2005-06	2004-05	2003-04

Note: a dash indicates that birds were recorded, but not thought to comprise different individuals to those in other seasons.

The all-year aggregate in 2006-07 is 48,643 which is the highest figure for this shorebird monitoring programme (table 2). This is a substantial increase of 46% from the previous year. The sum of spring and autumn aggregates is 27,892, which is also a considerable increase of about 60-70% from the figure between 16,000 to 17,000 birds in the sums of autumn 2004 and spring 2005, and autumn 2005 and spring 2006. This significant increase of the all-year aggregate is caused mainly by new high figures of the wintering Pied Avocets and the spring passage Curlew Sandpipers. Other species including Black-tailed Godwit, Spotted Redshank, Common Redshank and Common Greenshank had been recorded with different flocks in different seasons that could provide a clearer picture of presences of these birds that involved different individuals and so more figures could be added up for the all-year aggregates.

The ten highest numbers species recorded in this 12-month period were: Pied Avocet (11,957, 24.6% of the total number of shorebirds in the same period), Curlew Sandpiper (11,143, 22.9%), Common Greenshank (4,724, 9.7%), Common Redshank (3,160, 6.5%), Red-necked Stint (2,422, 5.0%), Spotted Redshank (2,390, 4.9%), Black-tailed Godwit (2,352, 4.8%), Marsh Sandpiper (1,662, 3.4%), Eurasian Curlew (1,049, 2.2%) and Wood Sandpiper *Tringa glareola* (1,008, 2.1%). In addition, small waders, presumed mainly to be Kentish Plover and Dunlin, were also recorded in 2,150 individuals, 4.4% of the total number of shorebirds in this period.

Shorebird turnover rates in Hong Kong have yet to be determined; however, Howes and Bakewell (1989) quoted studies using marked birds in Morocco and Malaysia as indicating that the total number of shorebirds using a given area during migration lies in the range 3 – 4.5 times the peak daily count of passage shorebird species. Using this as the calculation basis, with peak day counts of 22,740 in spring and 5,152 in autumn, totaling 27,892, Deep Bay may have supported in the range 83,676 to 125,514 migrant shorebirds during 2006-2007.

Regional important populations

Reviews and estimates of the known shorebird population size and the 1% level of the flyway or regional population of all waterbird species that is criterion 3c for determining a wetland of international importance are listed in a publication: Waterbird Population Estimates – Fourth Edition (Wetland International 2006). Significant proportions of the populations of some shorebirds species pass through the Mai Po Inner Deep Bay Ramsar site. These species are listed in Table 3 with their flyway or regional population, numbers recorded in the Ramsar site and percentages

of the flyway or regional during the course of July 2006 to June 2007.

Table 3. Species recorded in flyway/regional important numbers in the Deep Bay area during July 2006 to June 2007.

Species	Flyway/regional population	Number recorded	Percentage
Pied Avocet <i>Recurvirostra avosetta</i>	1,000 (1% level)	11,957	12%
Black-tailed Godwit <i>Limosa limosa</i>	160,000	2,352	1.5%
Eurasian Curlew <i>Numenius arquata</i>	35,000	1,049	3.0%
Spotted Redshank <i>Tringa erythropus</i>	1,000 (1% level)	2,390	2.4%
Common Redshank <i>Tringa totanus</i>	1,000 (1% level)	3,160	3.2%
Common Greenshank <i>Tringa nebularia</i>	1,000 (1% level)	4,724	4.7%
Nordmann's Greenshank <i>Tringa guttifer</i>	500-1,000	51	5-10%
Terek Sandpiper <i>Xenus cinereus</i>	50,000	619	1.2%
Curlew Sandpiper <i>Calidris ferruginea</i>	180,000	11,143	6.2%

Globally threatened species

With regard to species listed in BirdLife International (2000, 2004, 2006), the following were recorded during July 2006 to June 2007 (population figures from Wetland International (2006)):

- Black-tailed Godwit *Limosa limosa*: listed as Near-threatened, the population may have declined at a rate of 30% over the last 15 years. A total of 2,352 individuals were recorded in the 12-month period covered by this report which includes a peak count of 693 birds in winter – a new high figure of this species in winter, and 1,659 birds during the spring migration. Regional population is set to 160,000 individuals and so 1.5% of the regional population was recorded in Hong Kong.
- Nordmann's Greenshank *Tringa guttifer*: listed as Endangered (i.e. facing a very high risk of extinction in the wild in the near future), the world population is estimated to be 500 to 1,000 birds. One was recorded in autumn 2006 and a total of 50 birds (i.e. 46 adults and 4 first-summer birds) were recorded in spring 2007, which constituted 5 to 10% of the world population. This all-year aggregate is more than a double to the figures in the previous three years (cf. 24 birds in spring 2004 and 2006, 22 birds in spring 2005).

- Asian Dowitcher *Limnodromus semipalmatus*: listed as Near-threatened, the world population is estimated to be 23,000. The peak count in spring 2007 was 132 birds and another six individuals were recorded in autumn 2006. This peak spring count is the highest count among in recent years, which had only 25 to 36 birds in the springs of 2004 to 2006.
- Spoon-billed Sandpiper: listed as Endangered, the world population is estimated to be fewer than 3,000 individuals and the population is considered to be decreasing. One was recorded in autumn 2006 and seven were noted in the spring 2007. This is a normal year for this charismatic shorebird.

Flagged shorebirds sightings

In the period of July 2006 to June 2007, a total of 190 sightings of flagged shorebirds were reported from the Mai Po and Deep Bay area. One additional sighting was recorded at Po Toi on 3 May 2007, referring to a Ruddy Turnstone flagged in South Australia. This total number of sightings is 13% higher than in the previous year, but still 15% lower than sightings reported in 2004-05. Most of the sightings refer to local re-sighting, i.e. birds flagged in Hong Kong, which has 141 records, 74% of the total sightings. Overseas sightings include birds from Victoria (orange), South (orange/yellow) and Northwest Australia (yellow), and Shanghai, China (white/black), of which the most frequent reported was birds flagged at Victoria in 24 sightings. The most frequent reported species is the Marsh Sandpiper (56 sightings, all local sightings) and the second was the Common Greenshank (37 sightings, with one overseas sighting). More details refer to appendix 4.

Other observations

Shorebird numbers in the Mai Po Inner Deep Bay area had shown a decreasing trend in the previous years (Anon. 2006). Therefore, the increase of numbers in the spring 2007 and also the all-year aggregates is very encouraging. Several factors would be related to this increase. Management activities carried out by WWF Hong Kong in the Mai Po Nature Reserve, e.g. earth-moving works and control of *gei wai* water level, look suitable for shorebird roosting. Disturbance of raptors to roosting shorebirds seems less frequent in this spring. However, the shorebird numbers often fluctuate that makes less easy to conclude the health of the shorebird population in a particular place.

Acknowledgements

We would like to thank Dr. Lew Young and staffs at the WWF HK in Mai Po Nature

Reserve for much help in habitat management to provide suitable shorebird roosting areas. We also thank Geoff Carey for giving comments for the earlier draft of this report. We are also grateful to members of the Hong Kong Bird Watching Society for providing sightings of the colour-flagged shorebirds.
