# **Waterbird Monitoring Programme at the Mai Po Inner Deep Bay Ramsar Site**

## **Monthly Waterbird Monitoring Summer 2007 Report**

### **1. Introduction**

Comprehensive counts of waterbirds in the Deep Bay area were first carried out as part of an Asian Waterbird Census first undertaken by the Hong Kong Bird Watching Society (HKBWS) in 1979. These continued in January every winter (excluding 1980) until 1992-93 when they were expanded to cover the winter period from November to March. With the establishment of the Mai Po Inner Deep Bay Ramsar Site, a monthly waterbird monitoring programme was developed which was coordinated and carried out by the HKBWS under the subvention by the Agriculture, Fisheries and Conservation Department (AFCD) from March 1998 to March 2004. Starting from April 2004, the Waterbird Monitoring Programme was arranged under a service contract funded by AFCD. Monthly counts of waterbirds in the site form a major part of this programme, the others being counts of shorebirds during the migration season, and egretry surveys during the breeding season. Monthly summary reports are produced, while seasonal reports are produced bi-annually, i.e. a summer report covering the period from April to September, and the winter report from October to March. This report concerns the summer period of 2007 under contract reference no. AFCD/SQ/19/07 during the period 2007-08.

### **2. Methodology**

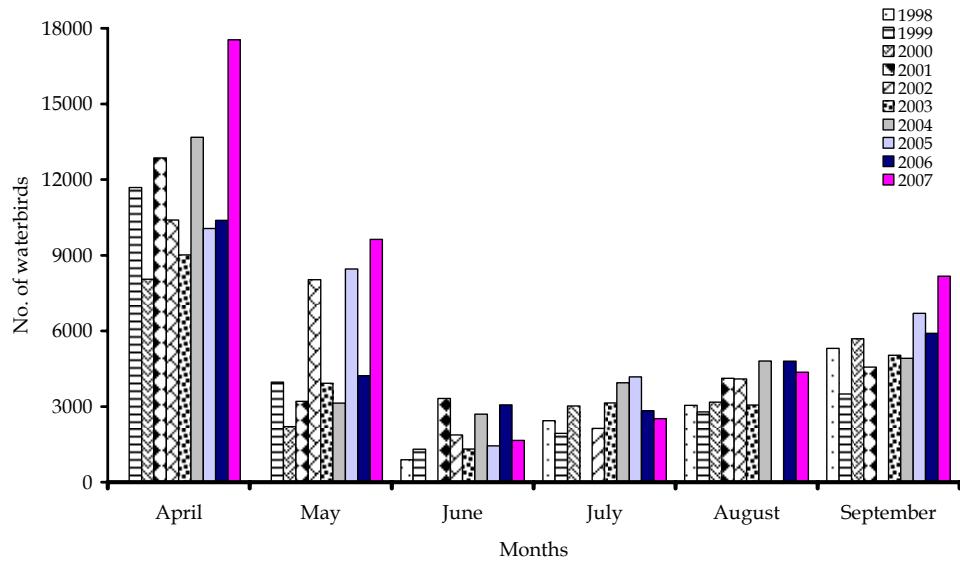

The methodology used and the areas covered are described in detail in the *Waterbird Count Handbook* (Carey undated, Carey 2002, Map 1, Map 2). In general, it involves surveying specified areas and, where possible, recording birds to individual fishponds or *gei wai*. Other variables, such as the vegetation surrounding each pond, the height of exposed edge to the pond and the percentage of pond bottom exposed as a result of drain-down are also measured four times a year. Tidal areas of Inner Deep Bay were surveyed simultaneously to ensure as little double-counting as possible occurs. Counts occur on a rising tide, preferably one that comes to about 2.0 m. Higher counts of individual species one week either side of the count date are included if they are considered to be more accurate than that made on the count day.

### **3. Results**

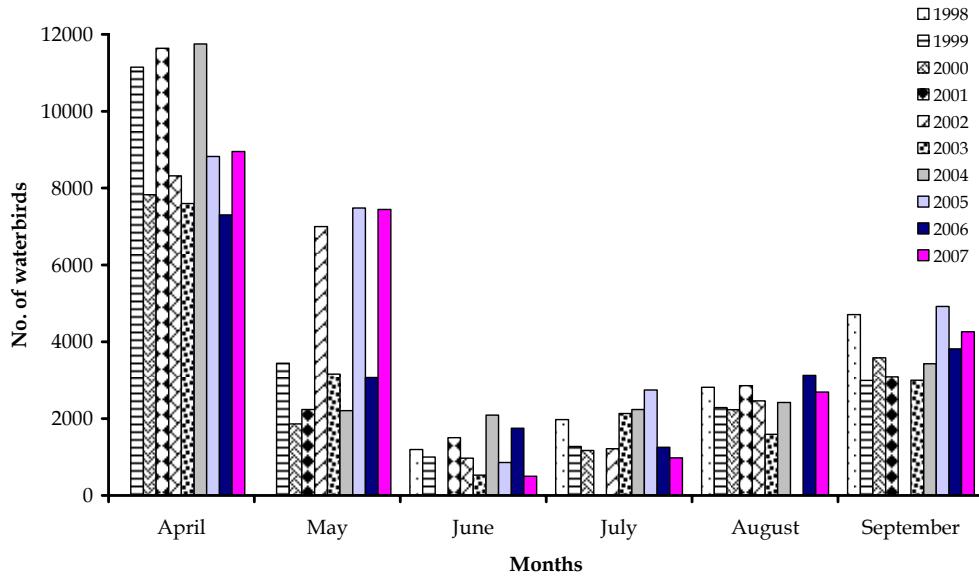

The waterbird counts were scheduled on 8<sup>th</sup> April, 6<sup>th</sup> May, 17<sup>th</sup> June, 15<sup>th</sup> July, 12<sup>th</sup> August and 9<sup>th</sup> September during the 2007 summer. Coverage was complete in the Ramsar Site area, while the count of the area of Deep Bay C, D, E, Lau Fau Shan

to Nim Wan in June was incomplete due to vehicle breakdown. Other areas including the Hong Kong Wetland Park at Tin Shui Wai and Futian National Nature Reserve at Shenzhen, China were completely covered in this summer. The total numbers of waterbirds recorded in the whole Deep Bay area were 17,545 (April), 9,630 (May), 1,657 (June), 2,518 (July), 4,361 (August), and 8,170 (September) (Figure 1), while the equivalent figures in the Mai Po Inner Deep Bay Ramsar Site were 8,952, 7,443, 501, 980, 2,692 and 4,262 (figure 2). Counts in the whole Deep Bay area in April, May and September are the new high figures for that months, while the counts of the Ramsar Site in June and July are the new low numbers since the commencement of the programme in 1998.

**Figure 1. Waterbird numbers in summer in Deep Bay area from 1998 to 2007.**

**Figure 2. Waterbird numbers in summer in Ramsar Site from 1998 to 2007.**

All counts in summer months since 1998 are listed in Table 1a and 1b. Details of counts in summer 2007 were reported in the monthly summaries which are available from the Waterbird Monitoring Programme website at:

<http://www.hkbws.org.hk/phpBB2/dload.php>

Summaries of each count are presented in Table 2-7. Discussion below refers to each waterbird species group.

### 3.1 Great Cormorant

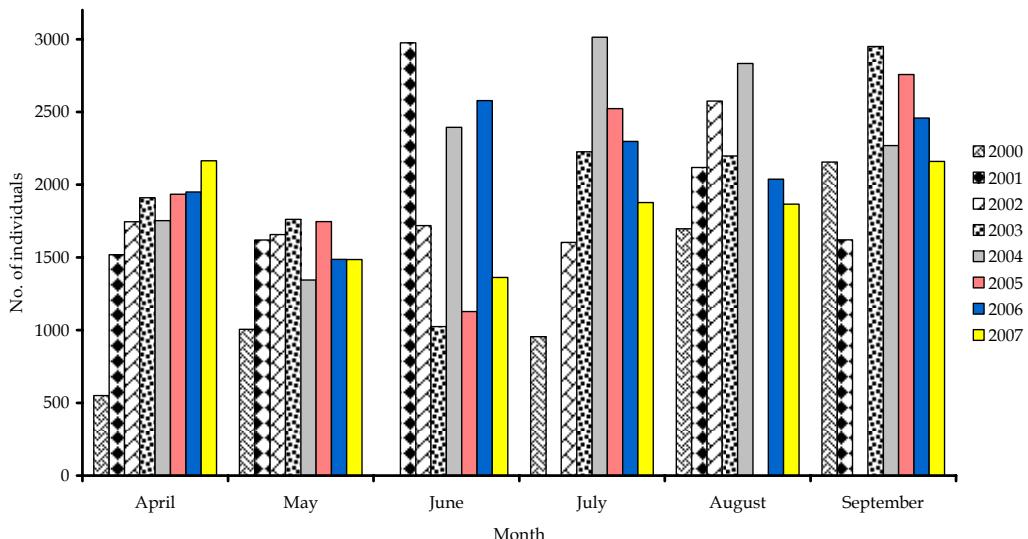

Great Cormorants were recorded only twice in April (two birds) and May (only one) counts in this summer. Several over-summering individuals were also recorded in recent summers (e.g. Anon 2004, 2005, 2006).

### 3.2 Ardeids

In 2007 summer, the peak of Ardeids count of 2,164 was recorded in April. Numbers remained fewer than 2,000 from May to August and returned to 2,159 in September count (Figure 3). The most numerous species is Little Egret (maximum count: 1,194 in September) and the Great Egret is the second highest one (maximum count: 547 in July). Chinese Pond Heron, which is of locally conservation importance, had a peak of 244 individuals in September. Ardeids comprised the largest group of waterbird in the Deep Bay area during the summer.

An egretry count was also undertaken in the summer to monitor ardeid breeding populations in Hong Kong under this Waterbird Monitoring Programme. Further details can be found in the Egretry Report published later this year.

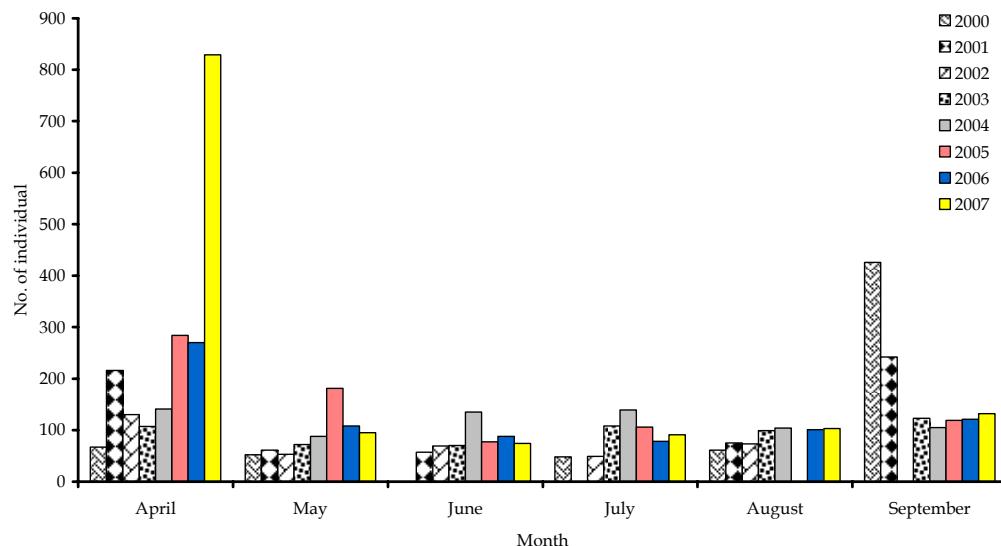

Figure 3. Numbers of Ardeids in Deep Bay area in summer months (2000-2007).

### 3.3 Ducks, Grebes, Pelicans

Peak number of this group was 829 individuals recorded in April and numbers remained low and similar (from 74 to 132 individuals) throughout the rest of the summer. Date of the April count was in early part of the month and some wintering ducks were present in the Deep Bay area. A few individuals of Common Teal and Northern Shoveler which are winter visitors remained in the Deep Bay area in this summer, while the resident Spot-billed Duck was not recorded in this summer. Spot-billed Duck has greatly declined in numbers in the past 15 years, though the causes are unclear. Figure 4 shows the figures of this group in summer since 2000.

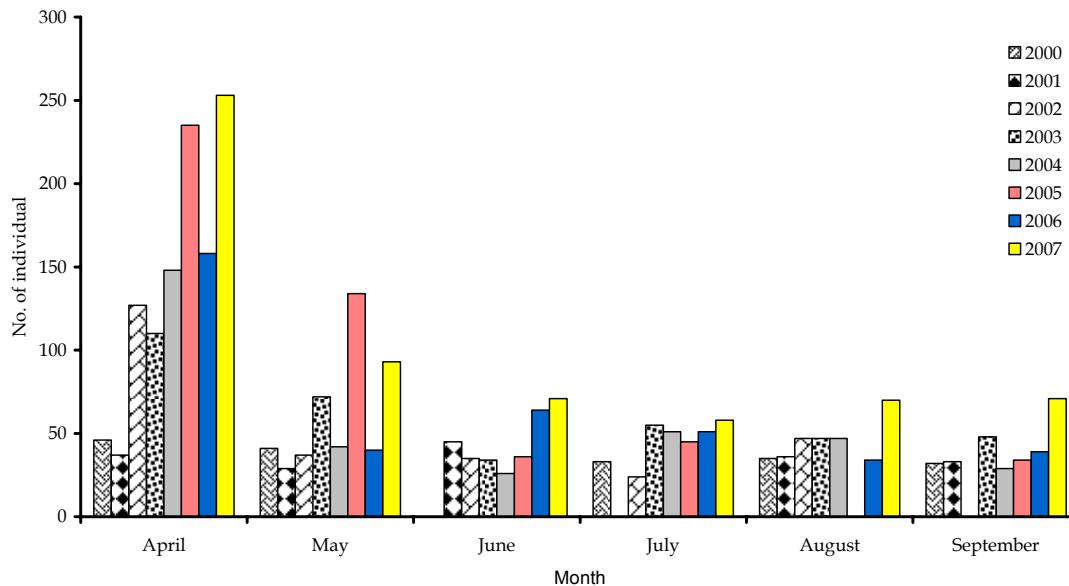

**Figure 4. Numbers of Ducks and Grebes in Deep Bay area in summer months (2000-2007).**

### 3.4 Rails and Coots

Numbers of this group are usually from two common resident species in summer months: White-breasted Waterhen and Common Moorhen. All figures of this group in this summer also refer to these two species, except for a sole Eurasian Coot recorded in the April count. The peak count of this group was 253 in the April count which is also the highest since 2000, while the counts in other months are in similar level (figure 5).

Figure 5. Numbers of Rail and Coots in Deep Bay area in summer months (2000-2007).

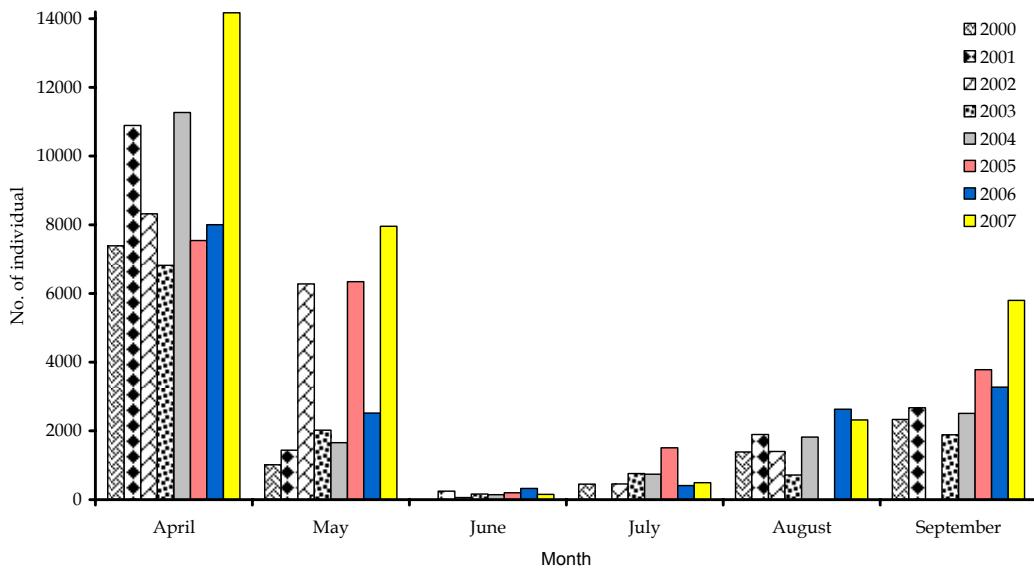

### 3.5 Shorebirds

Large numbers of shorebirds pass through Hong Kong in spring and so the April count is usually high. This year the peak count was 14,174 from the April count which is the highest count in April since 2000 and 26% more than the previous high count of 11,272 in April 2004. This large number was caused by the presence of wintering Pied Avocets (4,500 individuals) and passage Black-tailed Godwits (1,662) and Marsh Sandpipers (1,837). Shorebird numbers in the May count also reached a new high figure at 7,956 individuals, a 25% increase from the previous high of 6,347. Dates of conducting the waterbird count in April and May were in the early part of each month and this no doubt contributed to the higher numbers of shorebirds. More details of the numbers of the passage shorebirds are contained in the Shorebird Monitoring Report (Anon. 2007). Numbers of this group reached to the lowest level in June and rose again from July to September as southward migration occurred. For details refer to figure 6.

Black-winged Stilt and Greater Painted-snipe established a breeding population in the Mai Po Nature Reserve in the last few years. This summer the Black-winged Stilts still bred but the Greater Painted-snipe was not found in the reserve from the summer counts.

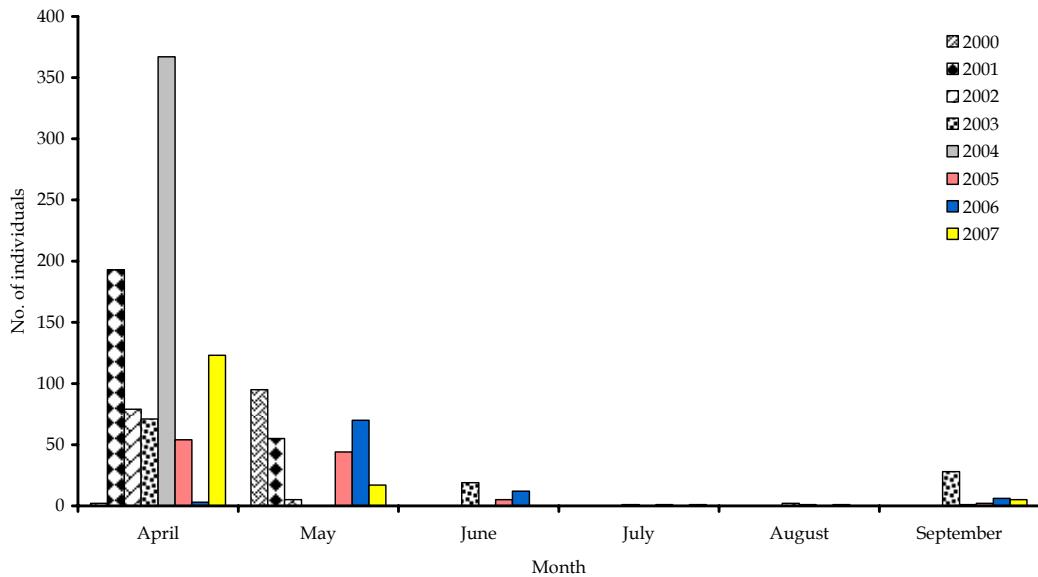

Figure 6. Numbers of Shorebirds in Deep Bay area in summer months (2000-2007).

### 3.6 Gulls and Terns

The peak count of this group was 123 individuals in the April count, which mainly comprised a total of 85 passage Gull-billed Terns. Numbers remained relatively low from one to seventeen birds throughout the summer. Figure 7 illustrates the figures of this group since 2000.

Figure 7. Numbers of Gulls and Terns in Deep Bay area in summer months (2000-2007).

### 3.7 Globally threatened species

Several globally threatened waterbird species were recorded in this summer period as follows:

Chinese Egret *Egretta eulophotes* (globally vulnerable) – two in April;

Black-faced Spoonbill *Platalea minor* (globally endangered) - 104 birds in April, 63 in May, 15 in June, 12 in July, August and September. This group of twelve individuals remaining in the Deep Bay area throughout this summer is the highest record at this time, and the group was still present in the October count.

Nordmann's Greenshank *Tringa guttifer* (globally endangered) - 46 in April and two in May. The count of 46 birds in the April count was a higher, compared to recent years.

[Spoon-billed Sandpiper *Eurynorhynchus pygmeus* (globally endangered) - none in the monthly waterbird count;]

Asian Dowitcher *Limnodromus semipalmatus* (globally near threatened) - one bird in April, 116 birds in May, one again in August and September. The figure from the May count was also a high number in recent years.

#### **4. Discussion**

Three counts this summer had new high figures of the total numbers of waterbirds in the whole Deep Bay area, indicating that the waterbird abundance in the whole area might have an increase. Shrink of egrets within the Ramsar Site area might cause the decline of numbers of total waterbird numbers in the area because Ardeids are the major component of the waterbirds present in the area in summer months. In general, the trend of waterbird numbers in summer is still unclear due to fluctuation of numbers and continuous monitoring is essential to establish a clearer trend.

#### **5. Acknowledgements**

Thank you for the following counters of the Hong Kong Bird Watching Society participated in the counts: John Allcock, Aukie Au, Mike Chalmers, Fion Cheung, Forrest Fong, Vivian Fu, Martin Hale, John and Jemi Holmes, Tony Hung, Hung Wai-ming, Alan Lam, Shirley Lam, Law King-wai, Lee Hok-fei, Richard Lewthwaite, Karl Ng, Pang Chun-chiu, Samson So, Sung Yik-hei, Mike Turnbull, Captain Lun-cheong Wong and Ying hak-king. We also thank Dong Wenxiao of Shenzhen Bird Watching Society (Szbws) for arrangement of counts and Szbws members for counting at Futian National Nature Reserve, AFCD for counting at the Hong Kong Wetland Park.
