# **Waterbird Monitoring Programme at the Mai Po Inner Deep Bay Ramsar Site**

## **Monthly Waterbird Monitoring Summer 2008 Report**

### **1. Introduction**

Comprehensive counts of waterbirds in the Deep Bay area were first carried out as part of an Asian Waterbird Census first undertaken by the Hong Kong Bird Watching Society (HKBWS) in 1979. These continued in January every winter (excluding 1980) until 1992-93 when they were expanded to cover the winter period from November to March. With the establishment of the Mai Po Inner Deep Bay Ramsar Site, a monthly waterbird monitoring programme was developed which was coordinated and carried out by the HKBWS under the subvention by the Agriculture, Fisheries and Conservation Department (AFCD) from March 1998 to March 2004. Starting from April 2004, the Waterbird Monitoring Programme was arranged under a service contract funded by AFCD. Monthly counts of waterbirds in the site form a major part of this programme, the others being counts of shorebirds during the migration season, and egretry surveys during the breeding season. Monthly summary reports are produced, while seasonal reports are produced bi-annually, i.e. a summer report covering the period from April to September, and the winter report from October to March. This report concerns the summer period of 2008 under contract reference no. AFCD/SQ/23/08 during the period 2008-09.

### **2. Methodology**

The methodology used and the areas covered are described in detail in the *Waterbird Count Handbook* (Carey undated, Carey 2002, Map 1, Map 2). In general, it involves surveying specified areas and, where possible, recording birds to individual fishponds or *gei wai*. Other variables, such as the vegetation surrounding each pond, the height of exposed edge to the pond and the percentage of pond bottom exposed as a result of drain-down are also measured four times a year. Tidal areas of Inner Deep Bay were surveyed simultaneously to ensure as little double-counting as possible occurs. Counts occur on a rising tide, preferably one that comes to about 2.0 m. Higher counts of individual species one week either side of the count date are included if they are considered to be more accurate than that made on the count day.

### **3. Results**

The waterbird counts were scheduled on 19<sup>th</sup> April, 11<sup>th</sup> May, 8<sup>th</sup> June, 20<sup>th</sup> July, 17<sup>th</sup> August and 14<sup>th</sup> September during the 2008 summer. All these counts could completely cover the whole Deep Bay area including the Mai Po Inner Deep Bay

Ramsar site, the Hong Kong Wetland Park at Tin Shui Wai and Futian National Nature Reserve at Shenzhen, China. The total numbers of waterbird recorded in the whole Deep Bay area were 28,666 (April), 6,359 (May), 2,500 (June), 3,363 (July), 5,332 (August), and 7,368 (September) (Figure 1), while the equivalent figures in the Mai Po Inner Deep Bay Ramsar Site were 17,458, 4,884, 1,147, 2,001, 3,493 and 4,534 (figure 2). Counts of the whole Deep Bay area and the Ramsar Site in April and August are the new high figures for those months since the commencement of the programme in 1998.

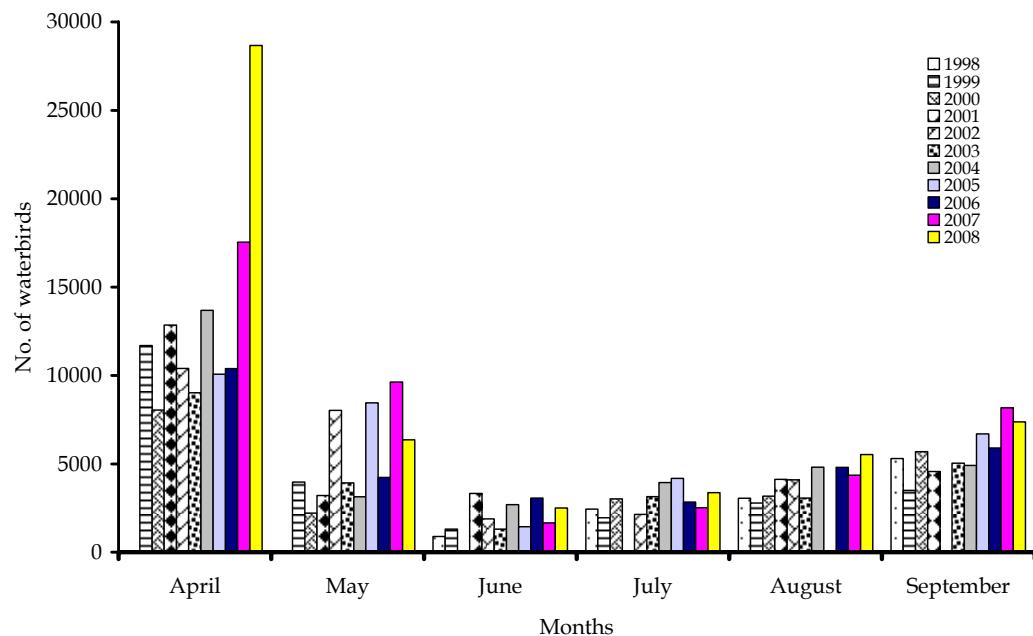

Figure 1. Waterbird numbers in summer in the Deep Bay area, 1998-2008.

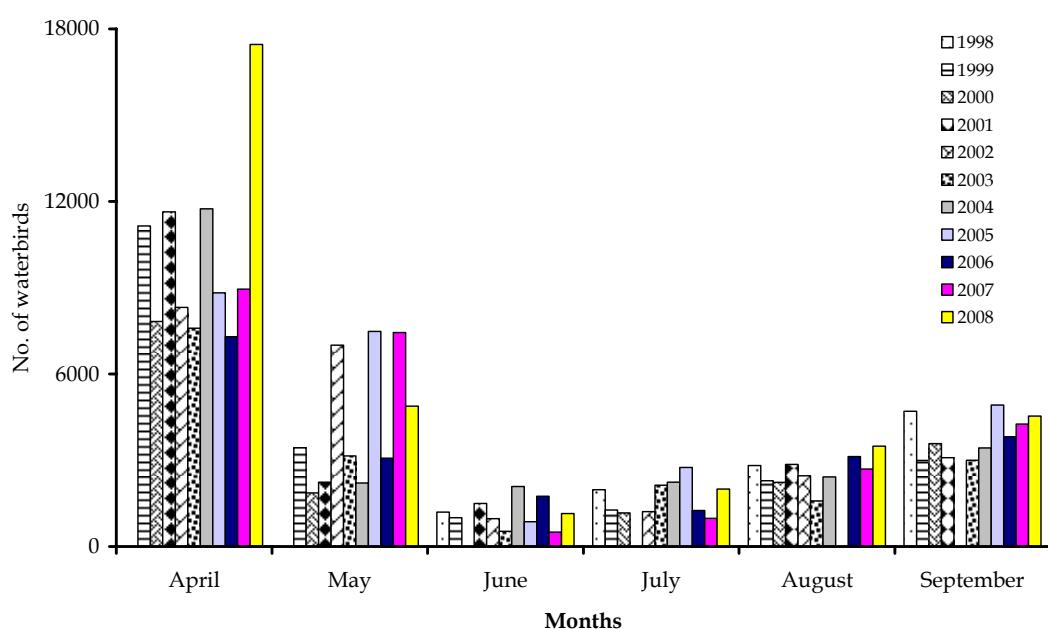

Figure 2. Waterbird numbers in summer in the Ramsar Site, 1998-2008.

All counts in summer months since 1999 are listed in Table 1a and 1b. Details of counts in summer 2008 were reported in the monthly summaries which are available from the Waterbird Monitoring Programme website at:

<http://www.hkbws.org.hk/waterbird/>

Summaries of each count are presented in Table 2-7. Discussion below refers to each waterbird species group.

### 3.1 Great Cormorant

No Great Cormorants *Phalacrocorax carbo* were recorded in the monthly waterbird count in 2008 summer.

### 3.2 Ardeids

In this summer, the peak count of Ardeids was 2,564 recorded in August and this high count was 18% higher than the previous year's peak count (2,164 birds in April 2007). Counts were lower in the early summer but increased afterwards and number remained over 2,000 individuals from June to September (figure 3). Little Egret *Egretta garzetta* was the most numerous species as 1,296 individuals were presented in the August count and Great Egret *Egretta alba* was the second commonest species with 816 recorded in the June count. The peak count of Chinese Pond Heron *Ardeola bacchus* was 260 presented in the September count. Ardeids comprised the largest group of the waterbird in the Deep Bay area, especially in the mid-summer period.

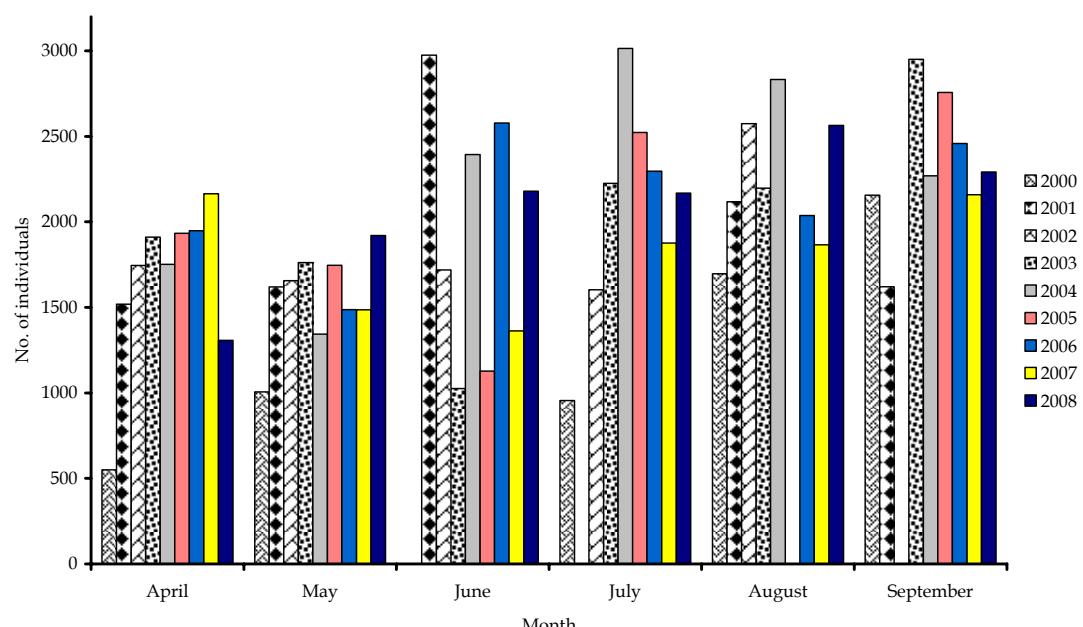

Figure 3. Numbers of Ardeids in the Deep Bay area in summer months (2000-2008).

An egretry count was also undertaken in the summer to monitor ardeid breeding populations in Hong Kong under this Waterbird Monitoring Programme. Further details can be found in the Egretry Report published later this year.

### 3.3 Ducks, Grebes, Pelicans

Numbers of this group were relatively low in this summer and the peak count was 292 recorded in the September count. As most of the ducks are only presenting in the Deep Bay area in winter, figures of this group in the summer months usually refer to the common resident Little Grebes *Tachybaptus ruficollis*. The highest count of the Little Grebe was 114 birds also recorded in the September count. Small numbers of Common Teals *Anas crecca*, Garganeys *Anas querquedula* and Northern Shovelers *Anas clypeata* were presented in the April and September counts. However, no resident Spot-billed Duck *Anas poecilorhyncha* was recorded in this summer, indicating that it had became even scarcer. Figure 4 shows monthly figures of this group in summer since 2000.

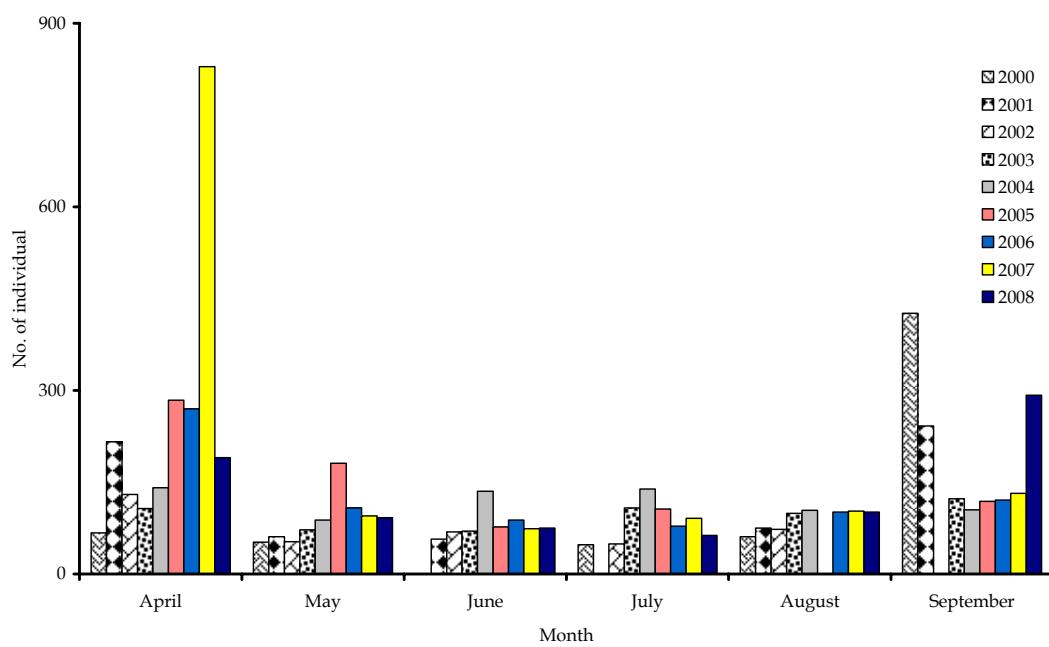

Figure 4. Numbers of Ducks and Grebes in the Deep Bay area in summer months (2000-08).

### 3.4 Rails and Coots

The peak count of this group was 173 individuals in the April count and numbers decreased below 100 and remained low in the other summer months. Figures were comprised almost totally from two common resident species: White-breasted Waterhens *Amaurornis phoenicurus* and Common Moorhens *Gallinula chloropus*, except only one Watercock *Gallicrex cinerea* recorded in the July count. Figure 5 shows the monthly numbers since 2000 and numbers of this group in this

summer are not in big difference to other years.

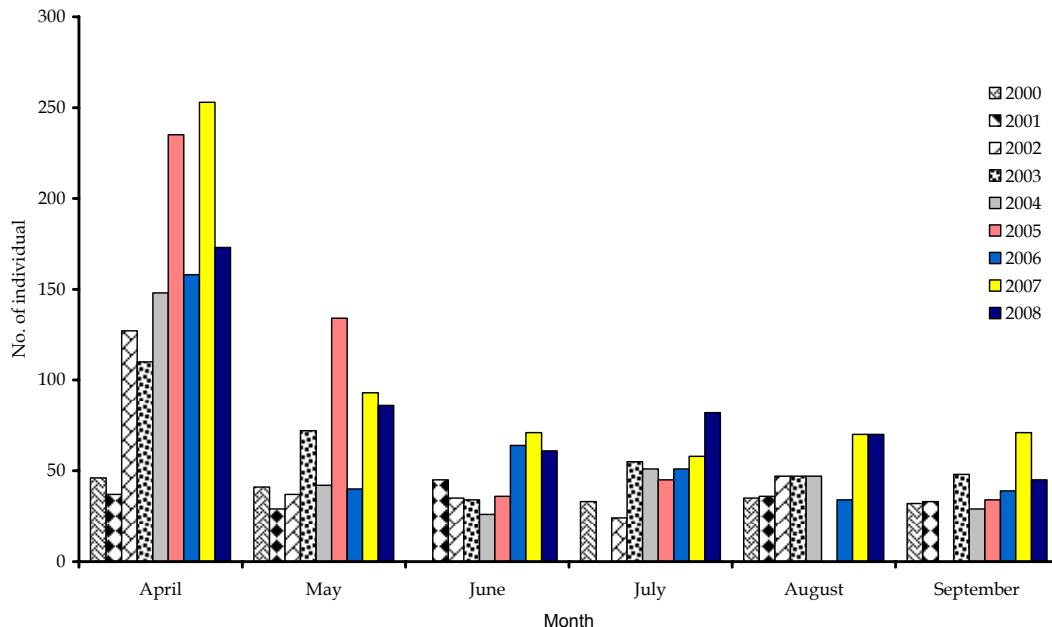

Figure 5. Numbers of Rails and Coots in the Deep Bay area in summer months (2000-08).

### 3.5 Shorebirds

Large number of shorebirds passes through Mai Po in spring and fewer numbers in the autumn. The summer waterbird counts could cover both of these periods and so shorebird is a major waterbird group presented in the counts. In summer 2008, a total of 26,723 shorebirds were recorded and this is a new high figure of this group in the April count. Such large number presented in the Mai Po area was thought to relate to the approach of a tropical cyclone Neoguri on 18 and 19 April. This figure has an increase of 89% from the previous year. In this count a total of 4,070 wintering Pied Avocet *Recurvirostra avosetta* still presented and 9,218 Curlew Sandpipers *Calidris ferruginea* were counted. The later is the second highest count in Hong Kong. In contrast, the May count was lower than the previous year. Shorebird numbers remained low in mid-summer period and Black-winged Stilt *Himantopus himantopus* and Greater Painted-snipe *Rostratula benghalensis* are still breeding in the Mai Po Nature Reserve in this summer but this monthly count could not provide representative figures of them because the birds became secretive during the breeding period. The shorebird number increased again in August and September when the shorebirds start their south-bound migration. Figure of the August count was the new high of this group in the summer waterbird counts. More details of the numbers of the passage shorebirds are contained in the Shorebird Monitoring Report (Anon. 2008) and some details refer to figure 6.

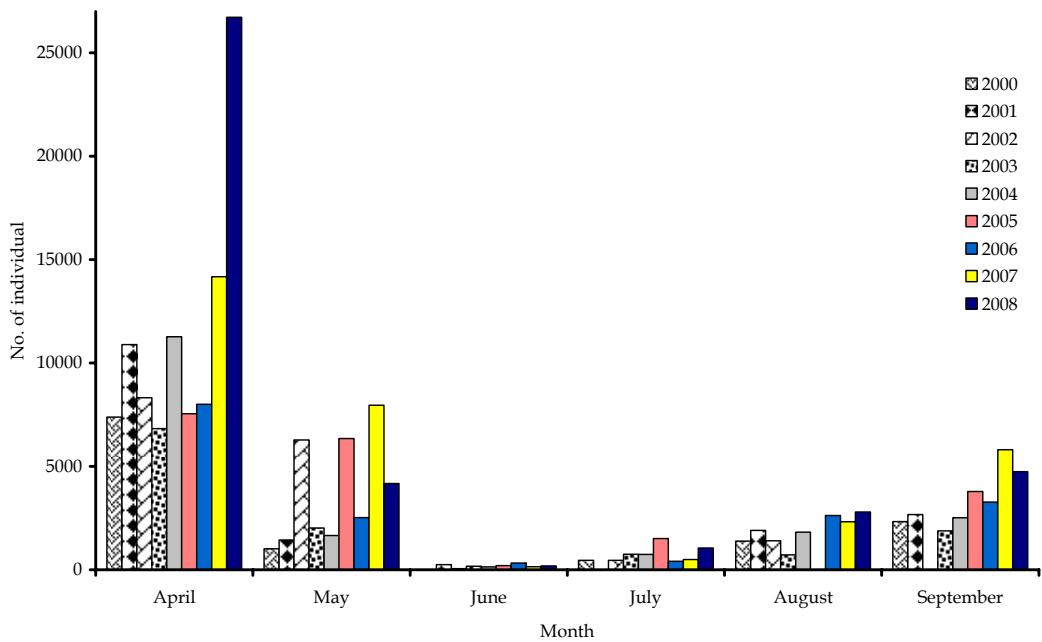

Figure 6. Numbers of Shorebirds in the Deep Bay area in summer months (2000-08).

### 3.6 Gulls and Terns

Number of this group reached a peak in the April count when comprised a total of 272 birds including a flock of 189 Gull-billed Terns *Sterna nilotica*. Subsequently, number decreased to 86 in the May count and no gulls or terns were recorded in June, July and September counts. This is a typical year for this group. Figure 7 illustrates the figures of this group since 2000.

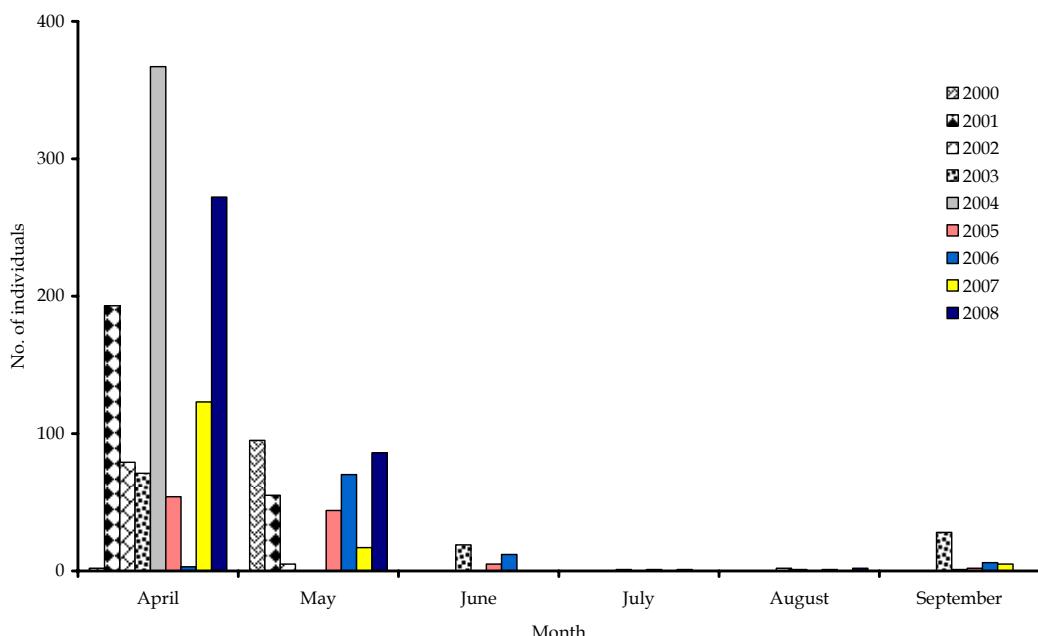

Figure 7. Numbers of Gulls and Terns in the Deep Bay area in summer months (2000-08).

### **3.7 Globally threatened species**

Several globally threatened waterbird species were recorded in this summer period as follows:

Black-faced Spoonbill *Platalea minor* (globally endangered) – 62 in April, 37 in May, four in June, three in July, two in August and in September. Immature birds are now regularly staying in Mai Po over the summer.

Black-tailed Godwit *Limosa limosa* (globally near threatened) – 790 in April, 96 in May, six in June and July, 145 in August, 368 in September.

Far Eastern Curlew *Numenius madagascariensis* (globally near threatened) – 12 in April, one in May.

Nordmann's Greenshank *Tringa guttifer* (globally endangered) – two in April, one in May.

Asian Dowitcher *Limnodromus semipalmatus* (globally near threatened) – 55 in April, nine in May, two in July, 25 in August.

Spoon-billed Sandpiper *Eurynorhynchus pygmeus* (globally endangered) – one in April.

## **4. Discussion**

In the previous summer waterbird numbers in the Ramsar Site were relatively low and it is encouraging to see some increase of that number in this summer. The April and August counts were also recorded as new high figures since the commencement of this project. The exceptionally high count in April was related to the weather condition. The increase in the August count was not very significant from the previous peak count. Weather was normal in the counting day and number of passage shorebird could fluctuate in large scale. Therefore the increase of the number could be genuine. Ardeids are the major group of waterbird present in the Deep Bay area in the summer time and recent shrink of egrets within the Ramsar Site might have negative impacts on their numbers. However, this monthly count could not provide a clear picture of it and more details could be referred to the Egret Count also under this monitoring programme. The number of waterbirds presented in summer is smaller but less fluctuated as the numbers in winter and the monthly numbers of this summer are typical comparing to other years.

## **5. Acknowledgements**

Thank you for the following counters of the Hong Kong Bird Watching Society participated in the counts: John Allcock, Aukie Au, Fion Cheung, Gary Chow, Forrest Fong, Vivian Fu, Martin Hale, John and Jemi Holmes, Tony Hung, Hung Wai-ming, Shirley Lam, Apache Lau, Roger H. Lee, Lee Hok-fei, Mike Leven, Richard Lewthwaite, Karl Ng, Pang Chun-chiu, Shum Ting-wing, Sung Yik-hei, Mike Turnbull and Captain Lun-cheong Wong. We also thank Dong Wenxiao of Shenzhen Bird Watching Society (Szbws) for arrangement of counts and Szbws members for counting at Futian National Nature Reserve, AFCD for counting at the Hong Kong Wetland Park.
