Waterbird Monitoring Programme at the Mai Po Inner Deep Bay Ramsar Site

Monthly Waterbird Monitoring Summer 2010 Report

1. Introduction

Comprehensive counts of waterbirds in the Deep Bay area were inaugurated as part of the Wetland international - Asian Waterbird Census has been undertaken by the Hong Kong Bird Watching Society (HKBWS) since 1979. These continued in every January (excluding 1980) until 1992-93 when the duration covered by the counts was expanded to cover the winter period from November to March as a part of the HKBWS "Winter Waterbird Count". With the establishment of the Mai Po Inner Deep Bay Ramsar Site, a monthly waterbird monitoring programme was developed which was coordinated and carried out by the HKBWS with support rendered by the Agriculture, Fisheries and Conservation Department (AFCD) since 1998. Monthly counts of waterbirds in the site form a major part of this programme, supplemented by counts of shorebirds during the migration season, and egret surveys during the breeding season. Monthly summary reports are compiled, while seasonal reports are produced bi-annually, i.e. a summer report covering the period from April to September, and the winter report from October to March of the ensuing year. This report is concerned with the summer period of 2010 under the contract referenced AFCD/SQ/19/10 during the period 2009-10.

2. Methodology

The methodology used and the areas covered are described in detail in the *Waterbird Count Handbook* (Carey undated, Carey 2002, Map 1, Map 2). It involves surveying specified areas and, where possible, recording number of birds in individual fishponds or *gei wais*. Inter-tidal areas of Inner Deep Bay were surveyed simultaneously to avoid double-counting as far as possible. Counts are conducted during a rising tide, preferably one that comes to about 2.0 m. Higher counts of individual species recorded in one week before/after the count date are also included if such figures are considered to be more accurate than that recorded on the count day.

Numbers of waterbirds in this report are mainly presented with reference to two main areas: Deep Bay area and Mai Po Inner Deep Bay (Ramsar Site). Details of these areas can be referred to the winter waterbird count report (Anon. 2010).

3. Results

In summer 2010, the monthly waterbird count was scheduled on 18th April, 16th May, 13th June, 11th July, 8th August and 12th September. All the survey areas were covered in all these counts, except Shenzhen River B (SRB or called Ma Tso Lung) where was not surveyed in September 2010 due to the failure of the vehicle during the survey. There were no alternative count day can be scheduled due to the unfavourable daytime tidal condition. According to records of the same months in previous years, the SRB site accounts for approximately 5% of the total number of waterbirds in September. Therefore, overall figure was slightly affected.

The total numbers of the waterbirds in the whole Deep Bay areas in these months are 22,884 in April, 3,433 in May, 1,919 in June, 1,881 in July, 4,147 in August and 5,333 in September and the tolls in the Ramsar Site are: 13,973, 2,474, 746, 951, 2,879 and 3,862. All these above figures are also shown in figure 1 and 2.

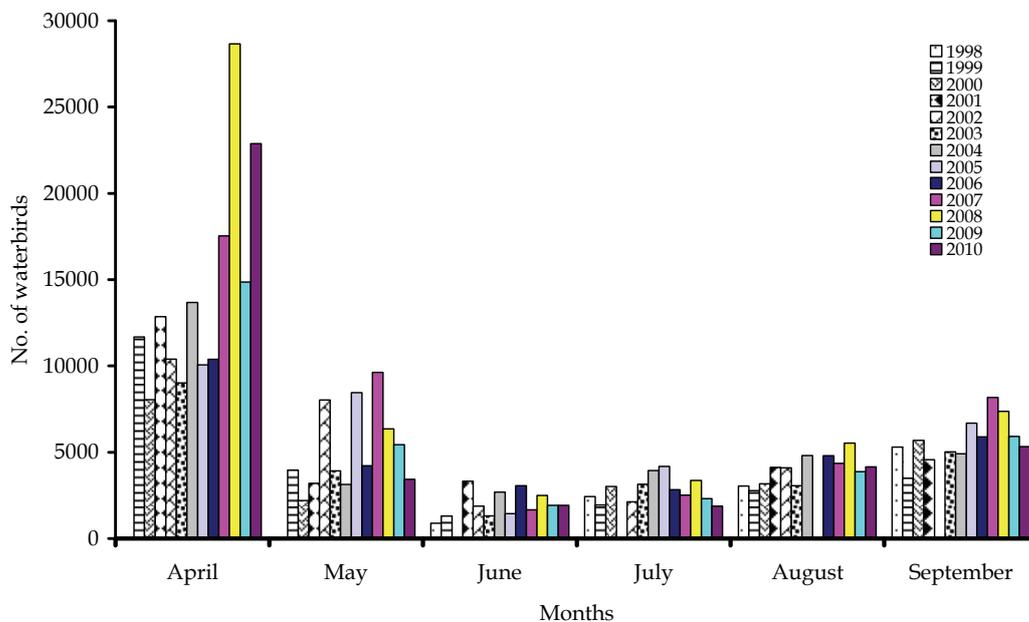

Figure 1. Waterbird numbers in summer in the Deep Bay area, 1998-2010.

Results of all counts in summer months from 1999 onwards are arrayed in Table 1a and 1b. Details of counts in summer 2010 were reported in the monthly summaries which are available from the Waterbird Monitoring Programme website at: http://www.hkbws.org.hk/web/eng/waterbird_report_eng.htm.

Summaries of each count are given in Table 2a to 2f and Table 3a to 3b. The following paragraphs 3.1 to 3.7 are discussions of the results with reference to each of the waterbird group and globally threatened species, supplemented by figure 1 to 7 which compares figures of each waterbird group counted in the summer months since 2000.

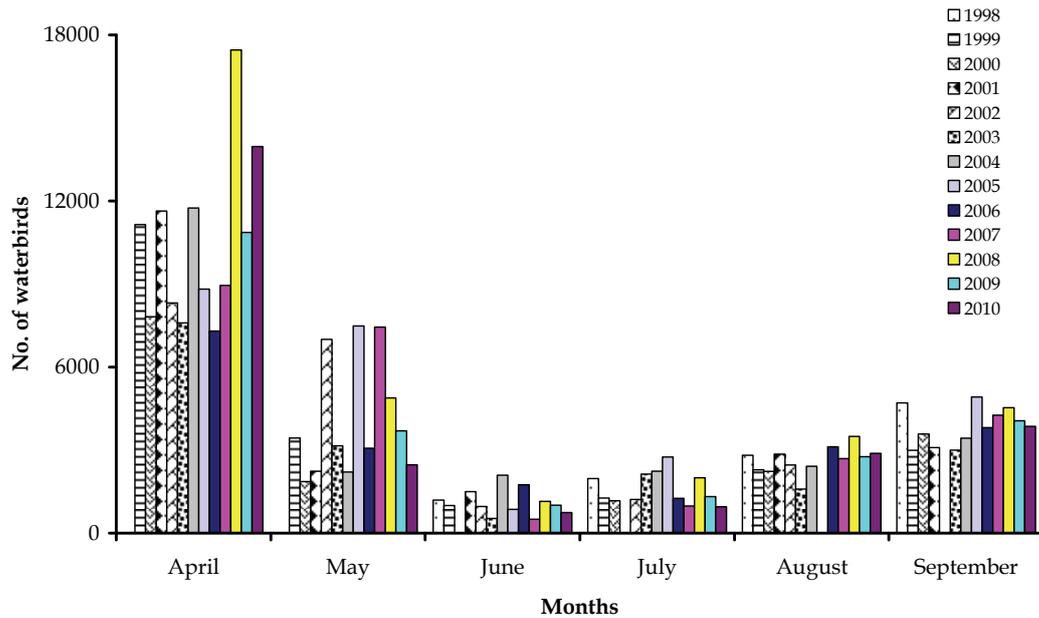

Figure 2. Waterbird numbers in summer in the Ramsar Site, 1998-2010.

3.1 Great Cormorant

In the summer months of 2010, only six Great Cormorants *Phalacrocorax carbo* were recorded in the April count and none in the other months. This species is mainly a winter visitor in the Deep Bay area.

3.2 Ardeids

The highest count of this group in Deep Bay area is 2,170 during the September count, symbolising an increase of 13% from the previous year's peak count in September (figure 3). The highest single species count was 843 Little Egrets *Egretta garzetta* in the September count, being an increase of 7% from the previous year's peak count. Eastern Great Egret *Ardea modesta* has the highest count of 659 individuals recorded in the September, also yielding an increase of 13%, while Chinese Pond Heron *Ardeola bacchus* only has a high count of 252 individuals in the September count, showing a slight increase of 4% from the previous year.

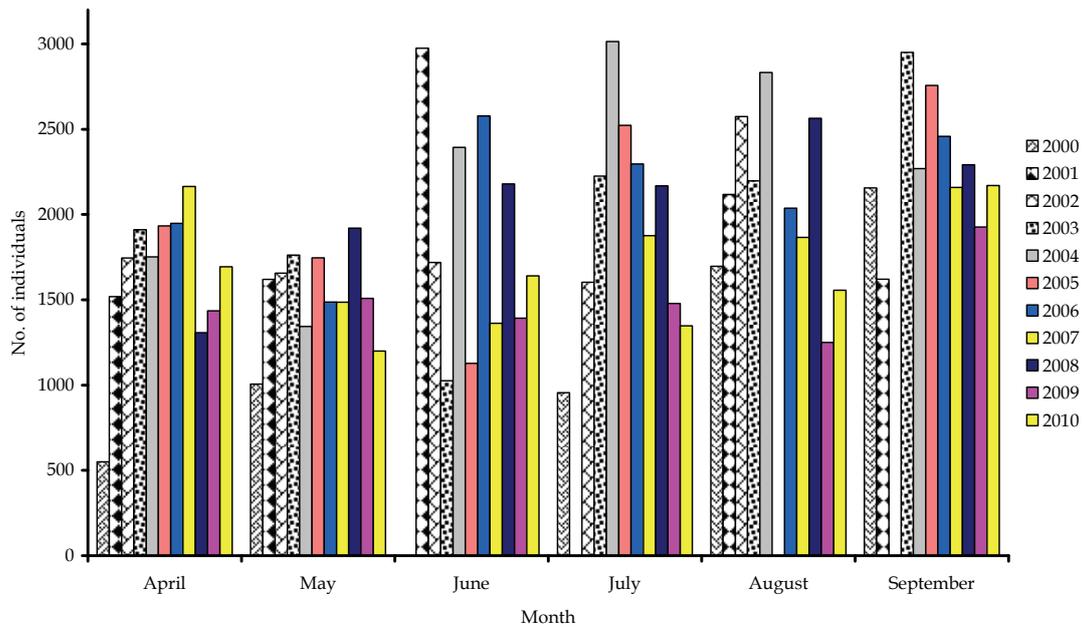

Figure 3. Numbers of Ardeids in the Deep Bay area in summer months (2000-2010).

Egretry count was also undertaken in the summer to monitor the breeding ardeid populations in Hong Kong under this Waterbird Monitoring Programme, further details can be found in the Egretry Report published in the later part of this year.

3.3 Ducks, Grebes, Pelicans

As most wintering ducks have left the Deep Bay area in the summer months, number of this group is usually low. As such, the toll is mainly attributed to the population of a passage duck species including Garganey *Anas querquedula* and the resident population of Little Grebe *Tachybaptus ruficollis*. In summer 2010, the highest count of this group was 333 during the April count, while the counts in other months are analogous to the results in the previous year (figure 4). The largest count of a single species in this group was 135 Little Grebes in the April count.

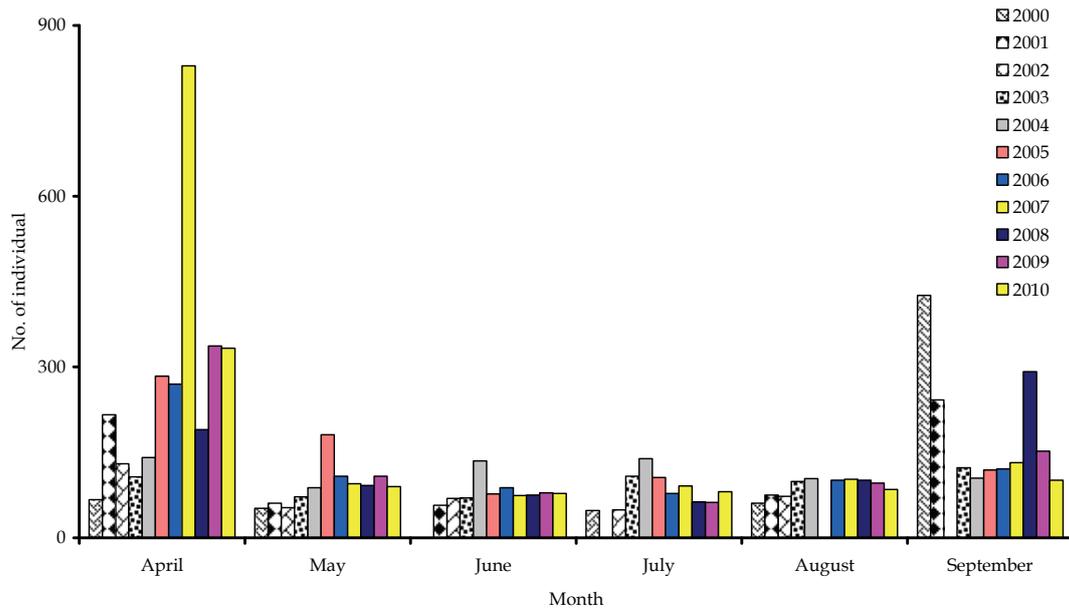

Figure 4. Numbers of Ducks and Grebes in the Deep Bay area in summer months (2000-10).

3.4 Rails and Coots

Many species of this group are very secretive, shy and small in body size. Other species in this group are mainly winter visitors, whereas some are rare resident species, e.g. Slaty-breasted Rail *Gallirallus striatus*, with limited number or records in each year. The counts for this group in the summer months usually refer to two common species: White-breasted Waterhen *Amaurornis phoenicurus* and Common Moorhen *Gallinula chloropus*. The highest count was 206 in the April count, bearing a 65% increase from the highest count in the previous year (likewise in April) (figure 5). Counts in the other months were similar to those in the previous years.

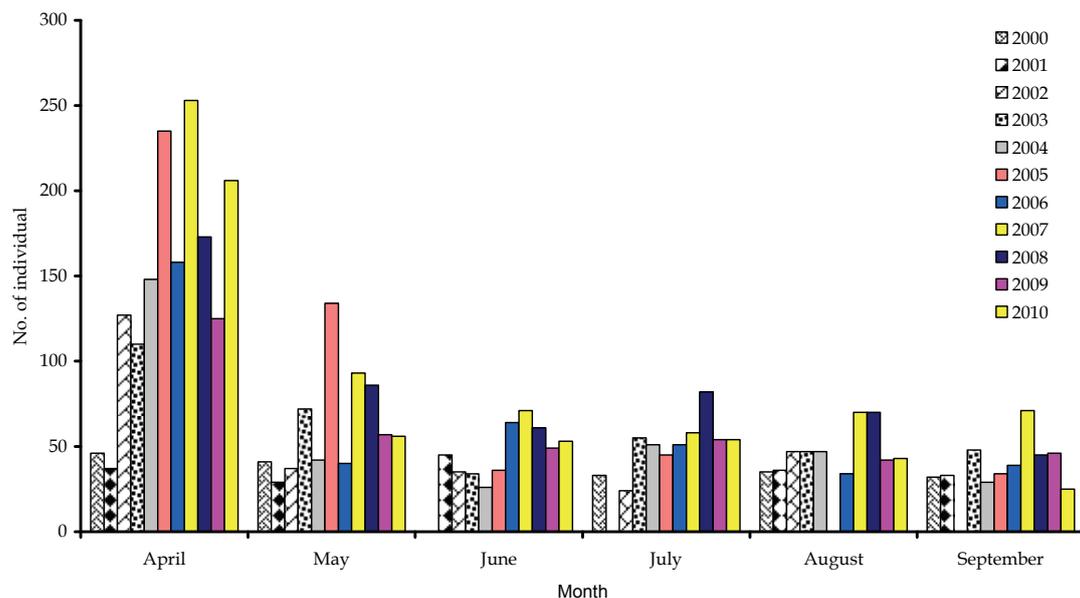

Figure 5. Numbers of Rails and Coots in the Deep Bay area in summer months (2000-10).

3.5 Shorebirds

Shorebirds are recorded in the large number in the Deep Bay area every spring, especially during the April count. This April count recorded a total of 18,768 individuals, being a 58% increase from the previous year's count (also in April) (figure 6). This high number was comprised by large numbers of Red-necked Stint *Calidris ruficollis* and Curlew Sandpiper *Calidris ferruginea*, with 3,694 and 4,316 individuals recorded respectively. The figure of the Red-necked Stint breaks the record for the Deep Bay area, though most of the birds (3,560 individuals) were present in Futian area, Shenzhen. Despite the above, counts in the other summer months are lower than the previous year's counts.

A few shorebird species breeds in the Deep Bay area in the summer and the largest group is the Black-winged Stilt *Himantopus himantopus*. A total of 80 individuals of Black-winged Stilt were recorded in the May count, many of which were considered to be breeding individuals although passage individuals might also be present at around this time of the year. Greater Painted-snipe *Rostratula benghanlensis* is another breeding species in the Deep Bay area but this species was only recorded in small numbers in this summer.

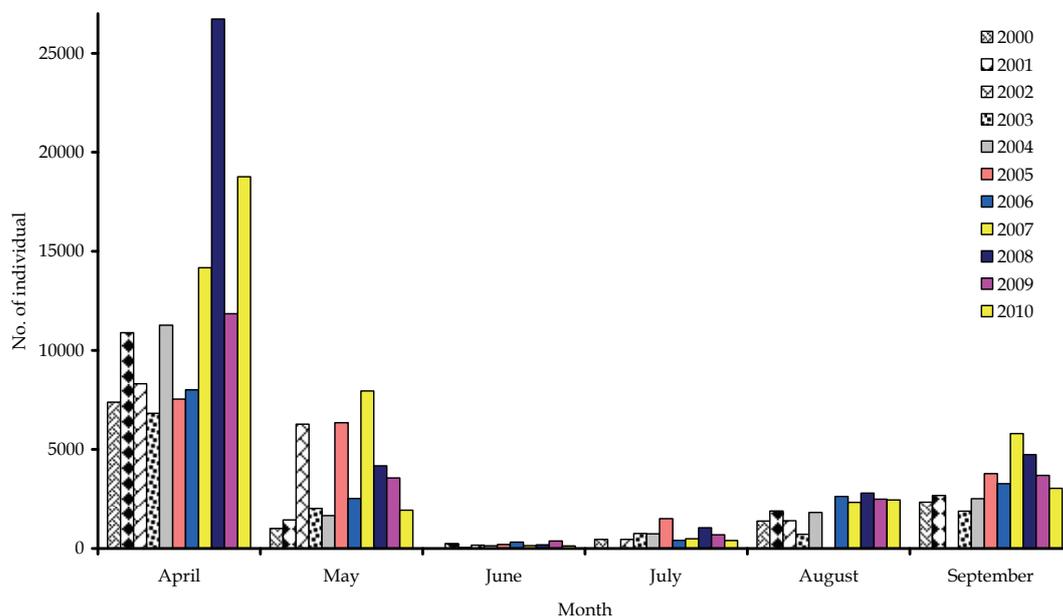

Figure 6. Numbers of Shorebirds in the Deep Bay area in summer months (2000-10).

3.6 Gulls and Terns

Peak count of this group was 1,877 recorded during the April count (figure 7), of which 1,478 Black-headed Gulls *Larus ridibundis* were presented. Black-headed Gull is a common winter visitor in the Deep Bay area and the individuals counted in the survey were part of the wintering group that lingered in the Deep Bay area till this

spring. In addition, the number of individuals of passage terns was small in this spring (April and May) and autumn (August and September), the most notable record being a total of 110 Whiskered Terns *Chlidonias hybrida* counted in the April count.

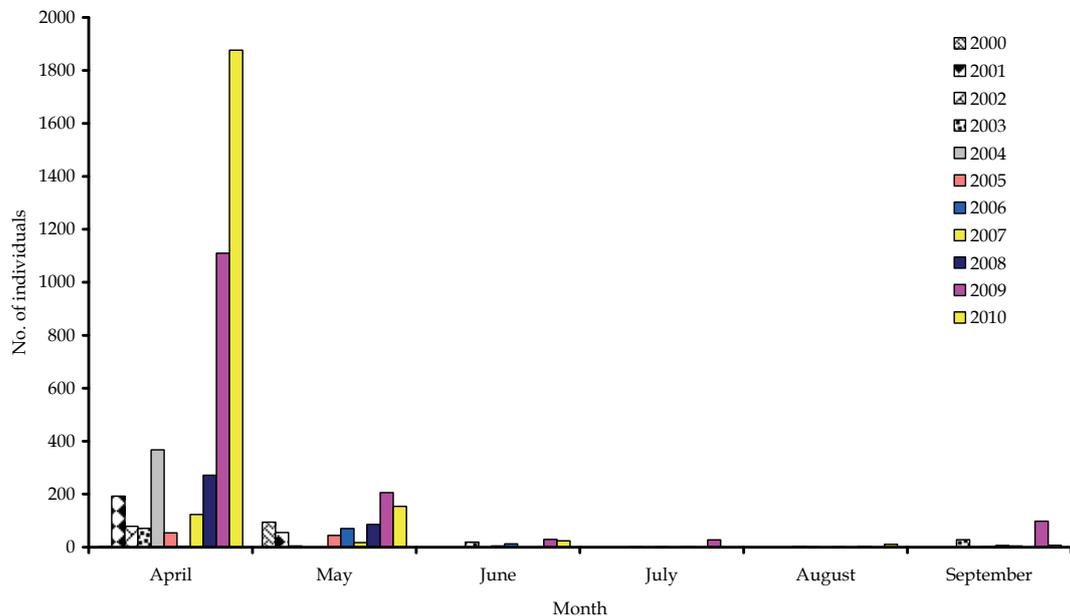

Figure 7. Numbers of Gulls and Terns in the Deep Bay area in summer months (2000-10).

3.7 Globally threatened species

Several globally threatened waterbird species were recorded in this summer period as follows:

Black-faced Spoonbill *Platalea minor* (globally endangered) - high number 235 individuals in April, subsequently 76 in May, 12 in June and seven in July.

Black-tailed Godwit *Limosa limosa* (globally near threatened) - 1,552 in April, 22 in May, two in June and July, 61 in August, 261 in September.

Eurasian Curlew *Numenius arquata* (globally near threatened) - 29 in April, 13 in May, ten in June, 12 in July, 61 in August and 63 in September.

Far Eastern Curlew *Numerius madagascariensis* (globally vulnerable) - 19 in April, three in May

Nordmann's Greenshank *Tringa guttifer* (globally endangered) - two in April, one in May.

Asian Dowitcher *Limnodromus semipalmatus* (globally near threatened) - 44 in April,

two in May, two in July, five in August and 14 in September.

Great Knot *Calidris tenuirostris* (globally vulnerable) - 11 in April, two in August and 17 in September

Chinese Egret *Egretta eulophotes* (globally vulnerable) and Spoon-billed Sandpiper *Eurynorhynchus pygmeus* (globally critically endangered) are regular spring passage migrants in the Deep Bay area. However, both of these species were not recorded during the waterbird count in this summer.

4. Discussion

Numbers of waterbirds in the Deep Bay area in 2010 summer months are apparently higher than those in 2009 because the average of counts in all months is higher (2010: mean = 6,600, SD = 8,087, n = 6; 2009: mean = 4,148, SD = 4,956, n = 6). A slight increase in the average numbers is also shown in the Ramsar Site area too (2010: mean = 4,148, SD = 4,956, n = 6; 2009: mean = 3,953, SD = 3,604, n = 6). This increase of waterbird numbers is mainly contributed by higher numbers of passage shorebirds presented in the April count and larger number of Ardeids present throughout the summer months. This is an encourage sign for the conservation of the Deep Bay and waterbird community that utilizes the area.

5. Acknowledgements

Thank you for the following counters of the Hong Kong Bird Watching Society participated in the counts: John Allcock, Geoff Carey, Bonnie Chan, Gary Chow, Forrest Fong, Martin Hale, John Holmes, Tony Hung, Hung Wai-ming, Alan Lam, Roger Lee, Carmen Or, Pang Chun-chiu, Sung Yik-hei, Jemi Wong and Captain Wong. We also thank members of the Shenzhen Bird Watching Society (SZBWS) members for coordinating the count at Futian National Nature Reserve, and the AFCD for counting at Hong Kong Wetland Park.
