## Winter 2007-2008 Report

Y.T. Yu ${ }^{1}$

## 1. Introduction

Long-term monitoring of waterbirds provides an indication of the health of the Deep Bay ecosystem. It is an important strategic aspect for the management of the Mai Po Inner Deep Bay Ramsar Site. This Waterbird Monitoring Programme was administered and executed by the Hong Kong Bird Watching Society Limited (HKBWS) under subvention from the Agriculture, Fisheries and Conservation Department (AFCD) from March 1998 to March 2004. Starting from April 2004, the Waterbird Monitoring Programme was arranged under a service contract funded by AFCD.

Monthly counts of waterbirds in the site form a major part of this programme, the others being counts of shorebirds during the migration season, and egretry surveys during the breeding season. This report concerns the monthly waterbird monitoring component for the winter period from October 2007 to March 2008 under the contract tender reference no. AFCD/SQ/19/07.

## 2. Methodology

Coordinated mid-monthly counts of wintering waterbirds in Hong Kong were carried out by members of the HKBWS on 7 October 2007, 11 November 2007, 9 December 2007, 13 January 2008, 17 February 2008 and 9 March 2008. The January count coincided with the Asian Waterfowl Census organized by Wetlands International - Asia Pacific. Counts from November to March have been carried out each winter since 1992-1993; counts in January were first carried out in 1979.

The survey area extends from fishponds at Ma Tso Lung in the east to the coastal fringe at Pak Nai and Nim Wan in the west and the Futian National Nature

[^0]Reserve in Shenzhen Special Economic Zone, China in the north. Since November 2004, counting of waterbirds in the Hong Kong Wetland Park at Tin Shui Wai was included as a part of this monitoring programme (Map 1 and 2).

In general, this monitoring programme involves surveying specified areas and counting waterbirds in individual fishponds, gei wai, streams, mudflat or marshes. Variables such as the vegetation surrounding and condition of each pond are also measured four times a year. Other variables including the height of exposed edge to the pond and the percentage of pond bottom exposed as a result of drain-down are recorded every month when these are required. Tidal areas of Inner Deep Bay were surveyed simultaneously so as to ensure the chance of double-counting was as small as possible.

During the winter months, there are substantial numbers of birds in the bay. However, there are very few diurnal tides of a sufficient height to force all waterbirds off the mudflat and onto roost sites inland. Counts were made on dates with a rising tide, preferably one that comes to about 2.0 m . High-tide counts of individual species made one week either side of the count date are included if they are considered to be more accurate than that made on the count day. This methodology used is described in detail in the Waterbird Count Handbook (Carey 2002, Map 1, Map 2).

Daytime high tides were not high enough to move the waterbirds closed to the Mai Po Boardwalk birdwatching hide in recent winters. An additional low-tide count was thus arranged in the mid-winter period (i.e. December to February), in order to providing extra information to the number of ducks and gulls present in the intertidal area. Counting was done in synchronous manner at four sites including Mai Po Nature Reserve, Mai Po Boardwalk birdwatching hide, Tsim Bei Tsui police jetty and the Futian National Nature Reserve, Shenzhen. These low-tide counts were scheduled on the same days of the high-tide counts and conducted in the low-tide period.

## 3. Results

The whole Deep Bay and the Ramsar Site was completely covered in all winter months, including the Hong Kong Wetland Park at Tin Shui Wai and the Futian National Nature Reserve in Shenzhen Special Economic Zone, China. The results of the six counts are summarized in Table 1; results in full are provided in appendices.

The winter peak montly count in the whole Deep Bay area is 90,132 waterbirds in January, of which 56,823 ( $63 \%$ ) waterbirds were counted in the Ramsar Site area. This count is the highest figure since the mid-winter Deep Bay Waterbird Count started in the 1980s. The Deep Bay area count is a significant $28 \%$ above that of the previous winter (table 1). The January count is usually used for further comparison to other previous winters because the winter peak counts were usually recorded in the January. Situation is simpler in this year because the total number and numbers of different waterbird groups in this January were also the highest. These figures show to have an increase of $37 \%$ and $22 \%$ from the 2007 January count in the Deep Bay and Ramsar Site area respectively (table 1).

Table 1. Comparisons of January and winter peak monthly count in the whole Deep Bay area and Ramsar Site, winter 2006-07 and 2007-08.

|  |  | Winter 2006-07 | Winter 2007-08 | Increase |
| :--- | :--- | :--- | :--- | :--- |
| January count | Deep Bay | 65,909 | 90,132 | $37 \%$ |
|  | Ramsar Site | 46,732 | 56,823 | $22 \%$ |
| Winter <br> monthly count | peak | Deep Bay | $70,303^{*}$ | 90,132 |
|  | Ramsar Site | $33,782^{*}$ | 56,823 | $68 \%$ |

$\wedge$ Winter peak monthly count is the highest count in the winter period.

* In winter 2006-07, the peak count of the whole Deep Bay area was the February count.

Monthly total numbers and numbers of each waterbird group are shown in table 2. The largest groups of wintering waterbirds comprised Ducks and Grebes at a total of 35,066 individuals in the January count, and Shorebirds (also known as waders) at 27,720 individuals also in the January count. Both of these figures are the new highs for the groups since the commencement of the mid-winter Waterbird Counts. Gulls and Terns were recorded at 11,787 individuals in the January count, which is slightly lower than the figure of 12,000 individuals of the previous winter.

Table 2. Numbers of waterbird counts, winter 2007-2008 by groups and areas.

| Group | Site | Oct | Nov | Dec | Jan | Feb | Mar |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

SI \& SW = Starling Inlet and Shuen Wan

Table 3 shows figures of different groups of waterbird in the mid-winter period since winter 2001-02. Except for Ardeids and Gulls and Terns, all others show increases from the previous winters and all are also the new high figures since the year 2000. Gulls and Terns dropped slightly, while the figure for the Ardeids this winter is the lowest since 2001.

Table 3. Peak numbers of different waterbird groups in the Deep Bay area during the mid-winter period (i.e. December to February) from 2001 to 2008.

| Winter | Cormorants | Ardeids | Ducks and Grebes | Rails and coots | Shore- <br> birds | Gulls and Terns |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

$\wedge$ Counts in mid-winter period of winter 2003-04 were modified by additional counts. Details are referred to Part II: additional counts of waterbirds in Deep Bay Intertidal area in January and February 2004 in Yu (2004) and Anon. (2005).

In order to avoid stochastic biases from using the January count alone and obtaining a more accurate picture of numbers of waterbirds that depend on Deep Bay for at least some part of the winter, the sum of peak species counts in the mid-winter period (December to February) was also used. This sum of peak species counts in winter 2007-08 is 90,986 individuals, including a total of 7,647 unidentified ducks. This figure is an increase of $14 \%$ from the previous year's same figure ( 80,108 individuals in winter 2006-07).

Low-tide count was conducted in the mid-winter period, i.e. December, January and February. In this winter only the number of Black-headed Gulls in the January count could be more representative than the high-tide count. All other waterbird groups have higher figures during the high-tide counts. Figures of each waterbird group recorded in the low tide counts are listed in table 4 and more details are shown in the appendix 2.

Table 4. Numbers of waterbird groups recorded in the Deep Bay area during low-tide counts, winter 2007-08. Numbers in parenthesis are the figures from the Ramsar Site area.

|  | December 2007 | January 2008 | February 2008 |
| :--- | ---: | ---: | ---: |
| Cormorants | $3,099(3,091)$ | $2,508(2,480)$ | $5,496(5,446)$ |
| Ardeids | $433(330)$ | $1,876(1,577)$ | $665(628)$ |
| Ducks, grebes and <br> pelicans | $13,890(9,890)$ | $17,161(14,655)$ | $15,549(6,834)$ |
| Rails and Coots | $37(31)$ | $43(43)$ | $320(300)$ |
| Waders | $3,541(3,505)$ | $6,037(200)$ | $2,886(2,041)$ |
| Gulls and terns | $4,900(4,900)$ | $11,600(11,600)$ | $3,162(3,152)$ |
| Total | $25,900(21,747)$ | $39,225(30,555)$ | $28,078(18,401)$ |

The ten most numerous waterbird species recorded in the Deep Bay area this winter were (in descending order): Pied Avocet Recurvirostra avovsetta $(16,123)$, Northern Shoveler Anas clypeata $(14,253)$, Black-headed Gull Larus ridibundis $(11,600)$, Great Cormorant Phalacrocorax carbo $(11,144)$, Eurasian Wigeon Anas penelope $(5,050)$,

Northern Pintail Anas acuta $(3,613)$, Common Teal Anas crecca $(2,785)$, Kentish Plover Charadrius alexandrinus ( 1,857 ), Marsh Sandpiper Tringa stagnatilis $(1,839)$, and Dunlin Calidris alpine $(1,800)$. The flocks of the Kentish Plovers and Dunlins were only recorded in the Futian National Nature Reserve in this winter. These ten commonest species comprised a total of 70,064 individuals, constituting $84 \%$ of the total winter peak number of all the positively-identified waterbird species.

## Species of conservation significance

Some species that occur in the Deep Bay Area are of conservation significance due to their being listed as globally threatened by BirdLife International (2000, 2004a, 2006a, 2006b), or because they are species for which Deep Bay supports, or may support, at least $1 \%$ of regional or flyway population, as used for implementing the Ramsar Convention criterion 3c. The ' $1 \%$ of regional or flyway population' is based on information provided by Wetlands International (2006). Brief reviews of these important waterbird species are provided below.

## Dalmatian Pelican Pelcanus crispus

Vulnerable
Single bird was firstly found from the Mai Po boardwalk on 20 February, three days after the February count. Apart from two birds recorded in winter 2005-06, none was seen in the Deep Bay area in winter 2006-07. The regional population is thought to be as low as only 50 birds (Simba Chan, Z.H. Chen and Y.T. Yu unpub. data).

## Great Cormorant Phalacrocorax carbo

A total of 11,144 individuals were recorded in an additional synchronous count at night roosting sites at Mai Po Nature Reserve and Nam Sang Wai during the January count period. This figure is a new high for Hong Kong and the previous highest count was 10,347 in winter 2005-06. The $1 \%$ regional population is set at 1,000 individuals (Wetlands International 2006) and hence the Deep Bay area supported about $11 \%$ of the regional population of this species in winter 2006-07.

## Black-faced Spoonbill Platalea minor

Endangered
The highest count in this winter was 369 individuals recorded during the 2008 International Black-faced Spoonbill Census, of which 38 were recorded in Futian National Nature Reserve, Shenzhen, China and the other 331 individuals were recorded from Hong Kong. The international census was conducted in the same weekend of the January count. This figure constitutes $18 \%$ of the known world population of this globally endangered species as the total population was counted
as 2,065 individuals during the 2008 International Black-faced Spoonbill Census (HKBWS data).

Falcated Duck Anas falcata
Near Threatened
Five individuals were recorded in January counts, same number as the previous winter.

## Northern Pintail Anas acuta

The highest count was 3,613 individuals recorded in December count, marginally higher than the 3,571 individuals recorded in the previous winter. The threshold value of $1 \%$ regional population is now set at 2,500 individuals (Wetlands International 2006), indicating that Deep Bay held $1.4 \%$ of the regional population of this species.

## Northern Shoveler Anas clypeata

A total of 14,253 individuals of this species were recorded in the January count, a new high figure for this species in the Deep Bay area. This is a $60 \%$ increase from the previous highest count of 8,930 last winter. However, only 1,733 individuals were counted on the Hong Kong side and the remaining 12,520 were recorded at Futian National Nature Reserve, Shenzhen, China. The 1\% regional population is set at 5,000 individuals (Wetlands International 2006) and therefore the Deep Bay wintering population was $2.9 \%$ of the regional population.

## Pied Avocet Recurvirostra avosetta

A total of 16,123 individuals were counted in the January count, a new high for the Deep Bay area. The previous one was 11,957 individuals which were just recorded in the previous winter and so this is a $35 \%$ increase. Most of these birds (15,920 individuals) were present from the Mai Po boardwalk bird watching hide. Numbers remained high over the winter and a total of 15,617 individuals were still counted in the March count. The $1 \%$ threshold value is set at 1,000 individuals (Wetlands Internationals 2006) and this new peak count constituted a total of $16 \%$ of the regional population.

## Kentish Plover Charadrius alexandrinus

The highest count was 1,857 individuals at the Futian National Nature Reserve, Shenzhen in the January count. The $1 \%$ regional population level is set at 1,000 individuals (Wetland International 2006) and so this figure comprises to $1.8 \%$ of the regional population. This is a significant figure because this species along with

Dunlin has become very scarce in the counts and it is thought that the daytime high tides are not high enough to push small-sized shorebirds closed to the Mai Po boardwalk bird watching hide.

Black-tailed Godwit Limosa limosa
Near Threatened
The highest count of this winter was 571 in the February count, which is a $18 \%$ decrease from the previous winter peak count.

## Eurasian Curlew Numenius arquata

The highest count was 1,116 individuals recorded in the January count, which is similar to 1,049 and 1,087 individuals recorded in the two previous winters. The 1\% threshold value is set at 350 individuals and the Deep Bay area supported 3\% regional population of this species.

## Far Eastern Curlew Numenius madagascariensis

Near Threatened
Six individuals of this species were recorded in the December count and this figure is higher than the usual records of one or two individuals. Perhaps these are late passage birds. There are also a few isolated winter records in the past (Carey et al. 2001).

## Common Greenshank Tringa nebularia

The highest count in this winter was 1,509 individuals recorded in the January count, which is similar to the historical peak count of 1,522 recorded last winter. This count constitutes $1.5 \%$ of the regional population as the $1 \%$ threshold value is set at 1,000 individuals (Wetlands International 2006).

## Saunders's Gull Larus saundersi

The highest count was 62 individuals in the February count, an increase of 10 birds or $19 \%$ from the previous winter's figure. The 1\% population threshold value is set at 85 birds (Wetland International 2006).

## Other notable counts

## Greater Crested Grebe Podiceps cristatus

The highest count of this species was only 100 individuals in the December count. This cannot meet the $1 \%$ regional population that set at 375 individuals (Wetland International 2006).

## Great Egret Egretta alba

The $1 \%$ regional population is set at 1,000 individuals (Wetland International 2006) and this species is usually recorded in numbers exceeding 1,000 in most previous winters. However, the highest count of this species was only 712 individuals in the January count, causing this species not to meet the $1 \%$ level of the regional population in this winter. The decline of this species coincided with the decrease of the Ardeid numbers in this winter.

## Common Shelduck Tadorna tadorna

The highest count of this species was 18 individuals in the February count and this species remained in low numbers in recent winters. Forty-four and three birds were recorded in the previous two winters.

## Tufted Duck Aythya fuligula

The highest count was 1,268 individuals in the February count, a 70\% decrease from the historical peak number of 4,285 individuals in the previous winter. The $1 \%$ regional population is now set at 2,500 individuals (Wetlands International 2006) and so the population this winter did not meet the $1 \%$ population level.

## Eurasian Coot Fulica atra

The highest count was 728 individuals recorded in the January count, with an increase of $17 \%$ from the previous winter. Although it is still low compared to the numbers in early 1990s, counts in recent winters show the number is recovering.

## Black-winged Stilt Himantopus himantopus

The highest count was 725 birds recorded in the March count, of which 701 individuals were counted in the Futian National Nature Reserve, Shenzhen. This is also the highest figure of this species recorded in the Deep Bay area.

## Dunlin Calidrius alpinus

A total of 1,800 individuals were counted in Futian National Nature Reserve, Shenzhen in the January count. However, this figure is still low compared to figures of several thousand individuals present in the mid-winter waterbird count before.

## Spotted Redshank Tringa erythropus

The highest count of this species was only 603 individuals in the January count, a decrease of $48 \%$ from the previous winter's figure. The $1 \%$ regional population is set at 1,000 individuals (Wetlands International 2006) and so this peak count could not meet the $1 \%$ regional population level.

## Black-headed Gull Larus ridibundis

The highest count of this species is 11,600 recorded during the low-tide count of the January count. This figure has a marginally decline from the highest count of 11,978 in the previous winter.

## Conclusion

Monthly count, mid-winter count (i.e. 90,132 birds) and sum of the peak species counts (i.e. 90,986 including unidentified ducks) are recorded in new high figures in this winter. All these are unexpected because the trend of the wintering waterbirds in the Deep Bay area was fluctuating in recent years. The increases are also significant with $28 \%$ increase in the new monthly count and $14 \%$ of the sum of the peak species count from the previous winter. This is very encouraging for the conservation of the waterbirds and their habitats in this area.

The counting situation in the January count largely contributed to these high figures. Tide was much higher than the expected height causing many waterbirds to approach close to Mai Po boardwalk bird watching hides. This facilitated counting in the tidal area and so good numbers of shorebirds from the Mai Po boardwalk and ducks from Futian were made. The high tide was also high in the February count. Therefore, this unexpected good high tide caused low-tide counts in this winter to become less effective to provide additional figures of waterbirds present in the Deep Bay area.

A strong cold front came to Hong Kong in this winter and temperature had remained low for a long period in late January to early February. However, data from this monitoring programme cannot show any direct relationship to the low temperature and the increase of the wintering waterbird population in the Deep Bay area. The high number of waterbirds present in the Deep Bay area was recorded before the arrival of the cold front and this high number cannot be maintained longer with this cold weather. The number dropped considerably in the February count.

The increase of the wintering waterbird population in the Deep Bay area has been noted since last winter (i.e. winter 2006-07) and the major increase was thought to come with the improvement of the Futian National Nature Reserve, Shenzhen (Anon 2007). The Futian National Nature Reserve seems to remain in good situation in this winter and the Mai Po Inner Deep Bay Ramsar Site might also be improved as well. This is because the number of waterbirds present in the Hong Kong's Deep Bay
area is also increasing, e.g. nearly 16,000 Pied Avocets present in front of the Mai Po boardwalk. Disturbance from illegal mudskipper collectors seems to be reduced this winter and it is also encouraging, but regular patrols and prosecutions are still needed to completely eliminate this problem.

Lastly, 'Shenzhen River B' (or conventionally called Ma Tso Lung) is included in the monthly waterbird count since the beginning of this monitoring programme. Several globally threatened species including Black-faced Spoonbills, Imperial and Greater Spotted Eagles and Japanese Yellow Bunting were found. So, this area has high ecological value. Regular surveys are recommended to monitor the ecological condition of the site.

## Acknowledgements

I would like to thank the following counters for participating the counts: John Allcock, Geoff Carey, Mike Chalmers, Forrest Fong, Vivian Fu, Martin Hale, Tony Hung, W.M. Hung, Alan Lam, Shirley Lam, H.F. Lee, Roger H. Lee, Mike Leven, R.W. Lewthwaite, Karl Ng, C.C. Pang, Y.H. Sung, Mike Turnbull, Captain Wong, H.K. Ying, Shenzhen Bird Watching Society and representatives from AFCD to the counts at the Hong Kong Wetland Park.
